

Wayward Navigation Rover

Austin Booth, Jacob Freeman, Andre Mbakwe, Garrett Shoemaker, Wesley Dodgen, Aaron Hoffman

Background Information

- Tasked to create a mobile robot platform to navigate through a garden
- Navigate remotely via cloud and mobile device
- Easy assembly requested (can be built with a kit/at home supplies)
- Design will be open source when completed

Milestones Achieved

- Created a platform that supports expansion
- Coded an I/O interface to allow users easy access to the robots mobility
- Constructed robot frame from 3D printed parts and PVC piping purchased locally
- Project will be placed on GitHub for open source release after completion

Traction and Drive Gear:

Meshed reinforcement for longevity

SuperDroids Robots Tread

Driven wheel on tensioner

Driving/Driven Sprockets:

Drive Flange attaches to sprocket across 4 bolts

Tensioning System:

Chassis Design and Structure:

Chassis Expansion:

Why a PVC Design?

- Modular
- Interchangeable Parts
- Expandable
- Cheap and easily accessible

Open Joints for
easy addition
of components

Electronics Housing:

Weatherproof Conduit
Box for housing all
support electronics

Clear Acrylic base plate for
added rigidity and mounting
surface for electronics housing

Base Plate and Electronics Housing:

Electrical Components

- Raspberry Pi
 - 5V input power from buck converter
- Adafruit Motor Hat
 - Controls up to 4 brushed motors
 - Stackable for future expansion
- DC Motors
 - Brushed
 - 12V, 0.5A
- Regulated Buck Converter
 - Set at 5V to power Raspberry Pi
- 12V LiPo Battery
 - Powers motors and Pi in parallel
- Power Switch

Electrical Assembly

- Wires routed through the frame for weather resistance
- Boards stacked and mounted to optimize space inside electrical housing

Software

- MQTT
 - A low over-overhead way to send and receive messages
 - It takes up very little space for devices and very bandwidth when messages are sent back and forth

Final Result:

Top:

Isometric:

Front:

Future Improvements:

- Incorporate camera for remote navigation
- Add a solar battery charger for increased autonomy
- Update suspension system to dual sprocket drive gears
- Expand robot chassis to support peripheral mounting
- Add additional protection against the weather/outdoors
- Upgrade motors in order to tackle more obstacles
